

SUPPORTING HEALTHY PARENTING IN PRIMARY CARE

An Initiative of the Collaborative on Healthy Parenting in Primary Care

The Collaborative on Healthy Parenting in Primary Care recognizes the accumulated evidence of the effectiveness of family-focused prevention programs that promote the physical and behavioral health and emotional well-being of children and families.

WHAT ARE FAMILY-FOCUSED PREVENTIVE INTERVENTIONS?

Family-focused preventive interventions are programs aimed at *promoting the cognitive, affective, and behavioral health of children and families*. These programs include universal interventions, such as those for expecting or new parents and for families whose children are entering adolescence, as well as programs targeted for parents whose children have challenging behaviors.

A strong evidence base finds that family-focused preventive interventions can *improve the well-being of children and families* and help promote cognitive, affective, and behavioral health in children. Research finds that these programs:

- increase positive parenting practices;
- reduce behavior problems in children; and
- reduce anxiety and depression in children.

WHAT MIGHT PREVENT FAMILIES FROM PARTICIPATING IN THESE PROGRAMS?

Stigma. A negative perception is sometimes associated with attending parenting programs. Some parents may see participation as a judgment of their parenting skills. Rather, parenting programs provide parents with resources for promoting the health and success of their children.

Expertise of Providers. Parents may have concerns about the expertise of the provider or legitimacy of the organization.

HOW CAN WE ENGAGE PARENTS?

In order to increase attendance and engagement in family-focused preventive interventions, a trusted and legitimate home for these programs is needed – and primary health care may be such a place.

Primary health care provides services to parents and families nearly universally and repeatedly to children in their first years of life and through childhood and adolescence, offering an opportunity to engage parents early in supporting their children's healthy physical and behavioral development. Several family-focused preventive interventions have been integrated into child health primary care systems and practices across the country. Research studies have shown positive effects, but additional rigorous studies are needed.

WHAT IS THE COLLABORATIVE ON HEALTHY PARENTING IN PRIMARY CARE?

The Collaborative seeks to advance the availability of preventive family-focused interventions for all children and families. Membership consists of *researchers, practitioners, and policy experts who aim to improve access to services* by engaging in the following activities:

- strengthen the evidence base through the identification and evaluation of promising programs;
- educate the general public and targeted audiences, including policy makers;
- strengthen the acceptance of integrating family-focused interventions into primary care among health care professionals; and
- identify, develop, and advocate for sustainable funding mechanisms.

COLLABORATIVE ACTIVITIES

The Collaborative on Healthy Parenting in Primary Care emerged from the 2014 Workshop on *Strategies for Scaling Tested and Effective Family-Focused Interventions*, hosted by the Forum on Promoting Children's Cognitive, Affective, and Behavioral Health. The Collaborative currently consists of over 100 members from around the nation who collaborate on a range of activities, including:

- Networking regarding research and funding opportunities
- Engaging stakeholders and identifying new partners
- Writing commentaries and articles
- Developing a learning collaborative of primary care providers implementing healthy parenting in primary care
- Presenting work of the Collaborative
- Sharing strategies for implementation and sustainability
- Developing plans for building capacity and training the workforce
- Engaging in quarterly membership calls
